

## Lab 4: Creating Java Packages

In this exercise, you will place the Account, TestAccount and TestAccount2 classes into different packages.

Figure below shows a UML diagram of the packages that you will create in this exercise. The Account class will be moved into com.mybank.domain package and the test classes will be moved into com.mybank.test package.

1. Create two Java packages with the following names.  
com.mybank.domain  
com.mybank.test
2. Move Account class into com.mybank.domain package.
3. Move all test classes into com.mybank.test package.
4. Make sure no errors in BankProject, and you can still run the test classes.
